

P01 Each pair below is a padding run of digits - every one exactly 120 twips wide in Liberation Serif at 12pt - then a token which straddles the 2400-twip (120.0pt) measure. Read where the token's tail goes: on the first line, or the second.

P02 A: a hyphen before digits: LB25 keeps them together and Word breaks after the hyphen. The padding is 14 characters = 84.0pt, so the token opens at 87.0pt and the character under test would fall at 115.0pt of the 120.0pt measure.

01234567890123 1997-05-12

P03 B: a hyphen before letters, the control: both break after the hyphen. The padding is 14 characters = 84.0pt, so the token opens at 87.0pt and the character under test would fall at 117.0pt of the 120.0pt measure.

01234567890123 alpha-beta

P04 C: a per-cent sign after a letter: FOP's pair table breaks before the sign and Word does not. The padding is 14 characters = 84.0pt, so the token opens at 87.0pt and the character under test would fall at 111.7pt of the 120.0pt measure.

P05 D: a per-cent sign
after digits, the control:
neither breaks before the
sign. The padding is 16
characters = 96.0pt, so
the token opens at
99.0pt and the character
under test would fall at
117.0pt of the 120.0pt
measure.

100% paid

P06 E: an en dash, the
control: class BA, both
break after it. The
padding is 13 characters
= 78.0pt, so the token
opens at 81.0pt and the
character under test
would fall at 113.0pt of
the 120.0pt measure.

0123456789012 alpha-
beta

P07 F: a solidus, the
control: FOP breaks
after it and Word does
not (word-layout-rules
4.3). The padding is 14
characters = 84.0pt, so
the token opens at
87.0pt and the character
under test would fall at
116.35pt of the 120.0pt
measure.
